1. Introduction

1.1 Overview of WorkCover Queensland

WorkCover Queensland (WCQ) is the main provider of workers' compensation insurance in Queensland. We are a government owned statutory body established under the Workers' Compensation and Rehabilitation Act 2003 (Qld). Our vision is "To be the best workers' compensation insurer and make a positive difference to people's lives."

A WCQ accident insurance policy covers injured workers for their lost wages and medical and rehabilitation costs after a workplace accident and covers employers against these costs and possible common law claims.

The main provisions of the Act provide the following for workers and employers:

- a) compensation
- b) access to damages
- c) employers' liability for compensation
- d) employers' obligation to be covered against liability for compensation and damages
- e) management of compensation claims by WCQ
- f) injury management, focusing on rehabilitation of workers particularly for return to work.

It is intended that WCQ will:

- a) maintain a balance between:
 - o providing fair and appropriate benefits for injured workers or dependents, and
 - o ensuring reasonable cost levels for employers
- b) ensure that injured workers or dependents are treated fairly
- c) provide for the protection of employers' interests in relation to claims for damages for workers' injuries
- d) provide for employers and injured workers to participate in effective return to work (RTW) programs
- e) provide for flexible insurance arrangements suited to the particular needs of industry

1.2 2025-2029 Corporate Strategies

1.2.1 Operations

- a) Invest in a performance-driven, accountable, and caring culture to enhance outcomes and support for injured workers and employers.
- b) Ensure WCQ is at the forefront of claims' management practices through streamlined and customer focused services that are timely, efficient, and simple to navigate, supported by uplifts to capability, processes, and technology.
- c) Leverage our cloud platform by investing in technology that expands and enhances customer engagement channels, elevates service delivery and outcomes, and strengthens the protection of our data and technology assets.

1.2.2 Workforce

- a) Align our business to the core needs of injured workers and employers, leveraging the important role of stakeholders and the broader community, to deliver positive claim and societal outcomes.
- b) Drive organisational excellence across the WCQ eco-system through continuous improvement in operations and services, optimising processes and investing strategically to deliver above and below the line value.

1.2.3 Risk

- a) Increase our focus on risk management to enhance oversight, systems, and governance, ensuring compliance and effective delivery of our strategic and operational goals.

1.3 Problem definition

The key challenges facing WCQ are as follows:

- a) Maintaining the financial sustainability of the fund in an environment where the composition of claims is changing and claim volumes are increasing.
- b) Proactively manage the increasing prevalence of, and challenging outcomes associated with, primary and secondary mental injury claims.
- c) Investing in uplifting the business whilst delivering high levels of services to our customers.
- d) Continuing the investment in technology and people to anticipate future challenges and opportunities within the guardrails of time, cost, quality and scope.
- e) Retaining and attracting the very best people to deliver excellence in care and outcomes.

A business model to enable WCQ to quickly adopt new opportunities, technology and digital services to overcome these challenges necessitates significant investment in foundational capability that is absent today.

WCQ's current data maturity is low, significantly limiting its ability to harness data as a strategic asset. As a result of historical underinvestment and the absence of a standardised, enterprise-wide approach to data, there is a siloed approach to analytics, access to critical data is limited, and the current data platform requires significant modernisation; all of which have impacted WCQ's ability to support decision-making, strategic planning, and efficient service delivery. This is coupled with WCQ's historic reliance on a single legacy platform for the last 23 years, which has resulted in a data ecosystem which is intrinsically tied to the limitations, functionality, and structure of the legacy platform.

The modernisation of WCQ's data platform will enable secure, governed access to trusted insights and driving data-informed decisions, increased operational efficiency, and digital innovation across the organisation. It is also a critical enabler to deliver the 2030 Strategic Roadmap and support the organisation into the future.

This document relates to the Modern Data Platform Project which is part of a broader transformation which seeks to modernise all aspects of the organisation. The current legacy

applications will also be modernised, and it is vital to ensure the data platform can support a modern, modular, future ecosystem.

1.4 Objectives of this initiative

The objective of this initiative is to source and implement the modern data platform and embed it into the organisations' operating model.

WCQ's future-state data architecture has been defined to support enterprise-wide data access, governance, and analytics capabilities. It needs to enable scalable ingestion, secure storage, structured transformation, and governed use of data across a variety of business and analytical use cases.

The architecture is structured into six conceptual layers:

1. Data Sources (Sources)
2. Data Movement (Move)
3. Data Storage and Transformation (Store and Transform)
4. Data Usage (Use)
5. Data Control (Control)
6. Data Users (Users)

2. Scope

2.1 Overview of the request

This ITO forms a key component of a multi-year, organisation-wide transformation initiative at WCQ, aimed at substantially enhancing data maturity and visibility, strengthening decision-making, and mitigating risk through improved governance, integration, and analytics capabilities.

WCQ envisions a staged rollout for the Modern Data Platform (**MDP**) - the collective term for the technology solutions delivering these capabilities. The initial phase will encompass:

- a) High Level Designs and Detailed Design of the MDP.
- b) Deployment of the core software platform(s) to enable the targeted capabilities.
- c) Design and documentation of patterns, processes and frameworks to steer ongoing development and adoption.
- d) Delivery of the defined Tranche 1 data ingestion pipelines and reports. This must demonstrate the practical implementation of the previously designed solutions, patterns, processes, and frameworks.

Please note: Microsoft Power BI has already been selected as the semantic modelling and visualisation layer. **All Offers must be able to integrate with Power BI.**

This engagement begins with a focused package of work (platform design, standup and Tranche 1) to establish the platform and validate the core patterns. Subsequent tranches

may be sought as Statements of Work, as part of a major, multi-year transformation program. This may involve onboarding data, analytics, and reporting capabilities for a series of new operational systems that WCQ will be procuring and implementing over the coming years.

The scale of the overall program is significant: later sections of this document outline the breadth and depth of the planned initiatives, giving you clear visibility of the size, complexity, and potential this partnership represents.

2.2 Scope of Work

The following must be provided by the Supplier to meet WCQ business outcomes:

No	Scope Statement	Guidance to Supplier
1.	[Build] Staged implementation with value delivered at all stages. The first stage should deliver the following: • Design ○ Proposed technology solutions for the MDP that deliver: • Tools for data warehouse, ingestion, distribution, storage, modelling, transformation, resilience, compute, platform insights, telemetry, orchestration, data masking. • Tools for data governance, data catalogue, data lineage, data profiling, data quality, data quality monitoring, data quality remediation, data workflow and issue management. • Tools for analytics platform, semantic layer, BI (reporting, analytics) tools, testing tools. • A foundation for necessary future capabilities (e.g. ML, AI, real-time analytics) ○ Reference architectures and patterns for how to structure, develop, and manage a MDP. ○ Defining a Data Masking approach. ○ A support model to maintain and enhance the MDP. • Implementation ○ Foundational implementation of the technologies proposed for the MDP (Stand up). ○ Initial SSO integration with the WCQ Identity Access Management (IAM).	Please provide a comprehensive response that clearly delineates the technical approach, project plan, and delivery methodology for the scope of work. Responses must demonstrate how the proposed solution will achieve rapid realization of business benefits upon deployment and deliver the project in a manner that is both cost-effective and fiscally responsible. Clearly articulate the components of your proposed tooling, as well as high level views of your reference architectures and patterns. The Supplier response must be clearly provided in Part D – Response Form section 8.

	○ Implementation of the defined Tranche 1 data ingestion pipelines and reports, including the setup of monitoring of these. ○ Training of the administrators, and other key distinct user groups (excludes end users). ○ Documentation of delivered technology solutions, including configurations delivered.	
2.	[Support] for transformation as it is occurring over the next 4 years	WCQ's preferred support and operating model is described in section 6.2. Please describe in detail how you would support WCQ to achieve this. Providers may propose alternative support models. Any alternative model must include: • A clear diagram or description of the proposed model • A comparative analysis showing why the alternative will deliver better outcomes for WCQ in terms of cost, speed of resolution, knowledge retention, flexibility, risk, and/or user experience • Identification of any, risks, or contractual implications, and additional costs (costs to be included in the Pricing Table) The Supplier response must be clearly provided in Part D – Response Form section 9.
3.	[Handover] Support for transition of functional support to a BAU function as it is being built (no throwing over the fence)	WCQ's preferred support and operating model is described in section 6.2. In your response, please describe: • The proposed structure of your implementation and support teams during the project (e.g., paired staffing, shadow/resident engineers, joint squads).

		• A detailed knowledge-transfer and training plan (classroom training, train-the-trainer, hands-on workshops, playbooks, run-books, certification paths, etc.). • Timeline and milestones for progressive handover of each component/module. • Success measures and acceptance criteria for “WCQ self-sufficiency” (e.g., WCQ staff independently handling 90% of L2 incidents, completing minor enhancements without Supplier assistance). • Post-go-live “hyper-care” arrangement and exit criteria. • Any tools, templates, or intellectual property that will be fully transferred to WCQ. The Supplier response must be clearly provided in Part D – Response Form in section 8.
4.	Supplier proposed optimal implementation pathway considering current state and future state	Considering the previous 3 scope items, your response must include: • A high-level roadmap (with phases, milestones, and timing) showing exactly how and when the future-state outcomes will be delivered • Explicit mapping of your proposed approach to each of WCQ’s stated preferences in the preceding sections • Where you propose any alternative approach (contracting, support model, integration method, handover method, etc.), provide a concise but compelling justification supported by evidence that convincingly demonstrates superior business outcomes for WCQ (e.g., lower TCO, faster time-to-value, reduced risk, higher staff adoption)

		The Supplier response must be clearly provided in Part D – Response Form.
--	--	---

2.3 Key Requirements

2.3.1 Mandatory Requirements

The following items are Mandatory Criteria:

- a) All personal data is not to be disclosed offshore (including Personally Identifiable Information (PII), Medical History) including in backups and failover environments. Where third-party sub-processors are located offshore WCQ require full disclosure on the third-party sub-processors including:
 - where the third-party sub-processors are located geographically;
 - what the third-party sub-processors do; and
 - what data the third-party sub-processors are using and/or storing.

The Supplier response must be clearly evidenced, demonstrating how the requirement is met in Part D – Response Form section 3.1; and

- b) Compliance with the Ethical Supplier Threshold (<https://www.business.qld.gov.au/running-business/marketing-sales/tendering/supply-queensland-government/ethical-supplier-requirements/threshold>); and
- c) Compliance with the Supplier Code of Conduct (<https://www.business.qld.gov.au/running-business/marketing-sales/tendering/supply-queensland-government/supplier-code-conduct/code>).

Offers that do not meet the above Mandatory Criteria will be set aside and will not progress to the next stage of the evaluation process.

2.3.2 Key Criteria

Offers that have passed the Mandatory Criteria will move to the Stage 2 evaluation and will be assessed on the Key Criteria below:

Criteria Statement	Description
Solution coherence and integration overhead	The proposed solution must operate as a cohesive, market leading, commercial off-the-shelf (COTS) platform with minimal integration overhead for WorkCover. It must be a mature, generally available product from the Supplier's standard product catalogue, offered by established global technology companies with a proven track record of innovation and long-term investment in the relevant domain. Suppliers must demonstrate that all proposed components are natively integrated, supported, maintained, and upgraded as part of the Supplier's standard offering, without requiring significant custom development, bespoke middleware, partner-developed

	'glue' code, or significant software built specifically for this opportunity. The solution must be supported by a mature partner ecosystem, including numerous certified implementation partners worldwide who routinely deploy and support the product for multiple customers. Solutions that do not meet these criteria, including those involving custom, proof-of-concept development, are undesirable. Please respond to this Key Criteria in a maximum of 1 page refer Part D Response Form. You can reference other parts of your response to support your response to these criteria
Commercial simplicity and single accountability	The proposed commercial model must minimise the number of contracts required for the solution and provide clear end-to-end accountability. Supplier must identify all contracting entities involved and demonstrate how responsibility for performance, integration, support and issue resolution will be managed through a simplified, consolidated contractual arrangement. Please respond to this Key Criteria in a maximum of 1 page refer Part D Response Form. You can reference other parts of your response to support your response to these criteria

Where the Supplier's Offer does not fully meet WCQ's Key Criteria the Supplier **MUST** clearly describe at minimum the areas below, for the Offer to be assessed for consideration and selection to move to the next stage of the evaluation including an invitation to the Supplier Demonstrations:

- a) The non-compliance; and
- b) The reason for the non-compliance; and
- c) The benefit to WCQ in adopting the proposed non-compliance opposed to the WCQ Key Criteria.

2.4 Tranche 1 Data Ingestion Pipelines and Reporting

This project will deliver an initial set of fully automated, production-ready data pipelines and reporting assets that address two distinct outcomes:

- a) Regulatory Reporting (monthly cycle)
- b) Management Reporting focused on the Corporate KPIs (daily refresh). There are 9 corporate KPIs at the time of writing this.

The solution must be built on modern cloud-native data platform technologies (to be proposed and justified by the Supplier). This tranche will establish and prove reusable patterns for future phases as per the requirements throughout this document and associated functional and non-functional specifications.

In both cases, there are outputs from existing systems that will serve as the benchmark for testing/validation. All outputs from this tranche are expected to match (in value, and in some cases format) the outputs from the legacy reporting processes.

In both cases WCQ expects the Supplier to:

- a) Design and implement the data acquisition methods, data storage, transformation, reports, and data governance to meet the requirements in this section.
- b) Implement all aspects using best practices according to their proposed designs, patterns and frameworks.
- c) Implement across Dev, Test, and Production environments, with production grade DevOps.
- d) Document all solutions to a level that would allow other suitably qualified persons to manage and extend the solutions in the future.

2.4.1 Regulatory Reporting (RR)

WCQ have a requirement to present monthly data extracts to the Office of Industrial Relations (OIR). *This deliverable will pick up data from the legacy claims system and deliver that data (with some minor transformation) into the new MDP and produce files from the new MDP (only to a local WCQ location).* This will facilitate the transition state and ongoing historical reporting once a new claims system is in place.

Below is a description of the scope items for this requirement:

Item	Description
Source System	An existing Oracle on-premises <i>style</i> database hosted in AWS.
Source Objects	Up to 66 tables (final count may be reduced following confirmation)
Data Layers	Selected source tables → Bronze (raw ingestion) → Silver (cleansed, conformed, historicised)
Gold Layer	Explicitly out of scope
Deliverables	16 fully automated regulatory file extracts (specifications already documented and will be provided at kick-off). The 16 file extracts will source their data from 16 tables (1 to 1 relationship). <i>The file extracts will only be required to be delivered internally to the WCQ network. Delivery to the OIR is out of scope.</i>
Frequency	Monthly full refresh
Reconciliation	End-to-end source-to-extract reconciliation as well as comparing to the files produced by the legacy solution.

Discovery	The requirements are very well known and documented. The Supplier will need to do almost no discovery.
Data Governance	The following data governance capabilities need to be implemented and demonstrated for this use case: • Data Lineage – Across Ingestion, Transformation, and Consumption. Automatically ingested from sources and data acquisition and/or transformation tools. Column level lineage is expected. • Dynamic Data Masking - Demonstrated using only one dataset/file. • Data Catalogue - Provide/demonstrate a searchable catalogue for data assets and terms. • Data Quality - Profiling - Demonstrated using the top 5 rules being currently used as part of Regulatory Reporting (low to medium complexity). • Data Quality - Rule and Template Management. Only what is needed to support the above requirement. • Data Quality - Monitoring - Only if this is automatically supported out of the box (requires no complex configuration). • Data Quality - Health Reporting - Only if this is automatically supported out of the box (requires no complex configuration). The following data governance capabilities need to be implemented and demonstrated either by this use case or by the Management Reporting use case, or a combination: • Business Glossary - Demonstrated using 5 business terms / concepts. • Data Dictionary - Demonstrated using the assets that match the 5 business glossary items above.

The decommissioning of the existing legacy file extracts falls outside the scope of this deliverable. It is anticipated that the regulatory reporting business owners will prefer to operate both the new and legacy systems in parallel for a period of several months prior to retiring the legacy extracts.

2.4.2 Management Reporting (MR)

WCQ have a requirement to present corporate reporting in a series of reports aimed at different audiences. *This deliverable will pick up data from the legacy systems and deliver that data (with some minor transformation) into the new MDP and facilitate reporting from the new MDP.* This will facilitate the transition state and ongoing historical reporting once new operational systems are in place.

Below is a description of the scope items for this requirement:

Item	Description
Source System	An existing Oracle on-premises <i>style</i> database hosted in AWS.

Source Views	Approximately 38 complex Oracle views
Source Materialised Tables	Up to 2 known materialised tables will be in scope; additional ones possible (TBC during discovery)
Replication of Complex View Logic	Explicitly out of scope for this tranche
Data layers	Selected source views and/or materialised tables → Bronze (raw ingestion) → Silver (cleansed, conformed, historicised) → Gold layer datasets
Gold Layer	Dimensional model(s) / tabular models to support the 9 Corporate KPIs
Semantic Layer	One or more Power BI Semantic Models (datasets)
Reports	Delivery of 6 Power BI management reports replicating existing reports (existing Qlik reports will serve as the specification of what is required).
Frequency	Daily refresh (incremental where possible)
Discovery	The requirements are well known. The Supplier will need to do some discovery. There will be a combination of available documentation and some Qlik reports that will need to be interpreted to gain a clear understanding of the details.
Reconciliation	Source-to-report reconciliation for the KPIs, and comparison with the existing Qlik reports.
Data Governance	The following data governance capabilities need to be implemented and demonstrated for this use case: • Data Lineage – Across Ingestion, Transformation, and Consumption. Automatically ingested from sources and data acquisition and/or transformation tools. Column level lineage is expected. • Data Catalogue - Provide/demonstrate a searchable catalogue for data assets and terms. The following data governance capabilities need to be implemented and demonstrated either by this use case or by the Regulatory Reporting use case, or a combination: • Business Glossary - Demonstrated using 5 business terms / concepts. • Data Dictionary - Demonstrated using the assets that match the 5 business glossary items above.

The decommissioning of the existing legacy reports falls outside the scope of this deliverable. It is anticipated that the management reporting business owners will prefer to operate both the new and legacy systems in parallel for a period of several months prior to retiring the legacy reports.

The required KPIs shall be those defined in the most recent corporate plan. The corporate plan is subject to periodic review, which may result in minor modifications to the KPIs; however, significant changes are not foreseen.

Suppliers must explicitly address and include the following information with as much detail as possible:

1. Recommended technology stack and architecture (with justification and diagram)
2. Approach to handling the two very different streams (regulatory (file extracts) vs management (Power BI))
3. Strategy for Oracle ingestion while avoiding replication of complex view logic
4. Indicative designs and patterns (data flow, layering, incremental logic, etc.)
5. Delivery methodology, phasing and suggested team structure
6. Testing strategy (unit, integration, regression, UAT, reconciliation, performance)
7. Data quality, monitoring, alerting and operational handover approach
8. Indicative project timeline with key milestones from kick-off to production go-live
9. Full list of assumptions, risks and proposed mitigations
10. CVs of key proposed personnel.

3. Future state expectations

This section looks at the current state across a range of analytical functions and describes our future state expectations. Noting these are for guidance only, and how the future state works is dependent on the implemented MDP and, to some extent, the new operational systems to be implemented.

3.1 Data Acquisition

Current State overview	Most data used for reporting is sourced from a single system without a uniform collection process.
Future State expectations	The future-state solution is expected to provide a robust, scalable, and flexible framework for ingesting and integrating data from a wide range of source systems into the MDP. It must support the ingestion of structured, semi-structured, and unstructured data using batch, near

	real-time, and streaming methods to meet diverse operational and analytical needs. Change Data Capture (CDC) must be supported for operational systems, with capabilities for replay and recovery to ensure data integrity and continuity. The solution should enable parallel ingestion from single and multiple source systems (where supported) and allow selective import of specific datasets and columns to optimise performance and reduce unnecessary data movement. Schema drift and evolution must be handled automatically and configured to align with governance policies, ensuring resilience and adaptability as source systems change. The platform must offer a broad set of managed connectors for relational databases, on-premises file systems, APIs, event streaming platforms, messaging services, and object storage. It should also support the integration of third-party and custom connectors, with clear processes for development, deployment, and lifecycle management, including security, governance, and compatibility with enterprise standards. Data movement activities must be orchestrated through a visual interface that supports scheduling, dependency management, and monitoring. The solution should support both notebook-based and UI-based development workflows, with integrated job scheduling, environment management, and version control to enable collaborative and repeatable operations. Finally, the platform must support querying data from external systems without requiring physical movement of data, through capabilities such as virtualisation, federation, and real-time integration. This will reduce duplication, improve agility, and support consistent access to distributed data assets. Where possible, meta-data driven approaches must be harnessed for data ingestion.
--	---

3.2 Data Storage

Current State overview	Data for reporting and analytics is siloed and inconsistent, with gaps in availability that limit decision-making. It is seen as unreliable for key uses, and past underinvestment has led to burdensome workarounds.
Future State expectations	The future-state solution will enable all data to be stored using consistent approaches and patterns, regardless of whether it is structured, semi-structured, or unstructured. This consistency simplifies governance, improves data discoverability, and reduces integration effort across systems. By supporting open file formats, the solution ensures long-term interoperability and avoids Supplier lock-in. Automated optimization of storage structures will enhance performance and reduce operational costs without manual intervention. Time travel

	capabilities will support auditability and historical analysis, helping teams make confident, data-driven decisions with full visibility into changes over time. Separation of storage and compute will allow for independent scaling of each. Where possible, meta-data driven approaches must be harnessed for data storage management.
--	--

3.3 Transformation

Current State overview	Multiple technologies are currently used to transform data, including legacy tools that are no longer fit for purpose. These tools persist in the environment due to historical decisions, budget limitations, and the absence of a unified transformation strategy. As a result, data teams often rely on inconsistent methods that are difficult to maintain and scale. Historical transformation approaches, shaped by past technology and budget constraints, frequently lead to inefficient use of compute resources, increased operational overhead, and limited flexibility in adapting to modern analytics needs. Additionally, fragmented processes create challenges in maintaining data lineage, performing impact analysis, ensuring proper documentation, and accelerating time-to-market for analytics solutions.
Future State expectations	The future-state solution is expected to provide a unified and scalable approach to data transformation that supports consistent, high-quality outcomes across the organisation. It should enable teams to prepare, enrich, and integrate data from diverse sources using repeatable and governed processes. These capabilities must support both batch and real-time scenarios, ensuring timely access to trusted data for reporting, analytics, and decision-making. The solution should accommodate a range of user needs from technical developers to data analysts by supporting flexible transformation methods, including visual tools and familiar languages. It must also promote collaboration, transparency, and accountability through features such as version control, change tracking, auditability, automated unit testing, column level lineage, documentation, inferring dependencies, modularity, reusability. The solution should reduce complexity, improve data quality, and accelerate the delivery of insights by embedding transformation capabilities directly into the broader data platform. Where possible, meta-data driven approaches must be harnessed for data transformation.

3.4 Data Analytics

Current State overview	The existing reporting environment is constrained by manual processes and a reliance on key individuals. New reporting needs are slow to fulfil and require high effort, creating bottlenecks and limiting scalability. The lack of data discovery tools prevents users from exploring and leveraging data independently.
Future State expectations	The future-state solution is expected to provide a unified, scalable analytics environment that supports timely, trusted, and actionable insights across the organisation. It must enable real-time and near real-time monitoring through the ingestion, processing, and visualisation of streaming data, allowing operational teams to respond quickly to emerging trends and issues. Strategic reporting must be supported through structured, repeatable dashboards and reports that inform planning, performance tracking, and executive decision-making. Business users and analysts should be empowered to explore data and generate insights independently through intuitive self-service tools, reducing reliance on IT and accelerating time to value. The solution must also support advanced analytics, including predictive modelling, machine learning, and statistical analysis, with clear pathways to operationalise these capabilities in a governed and repeatable manner. It should ensure consistency and governance across all types of analysis-real-time, strategic, ad-hoc, and predictive-while scaling to meet the needs of diverse domains and user groups. Support for multiple languages such as SQL, Python, and R is essential to accommodate a wide range of users and use cases. The solution must also enable the creation and reuse of semantic models and datasets that are optimised for both business intelligence and machine learning workloads, with built-in support for data modelling, performance tuning, and integration with analytics and ML tools.

3.5 Governance

Current State overview	The data governance and management maturity is currently rated as low, with many foundational technologies, processes, and roles not in place. There is no enterprise-wide data management tool, and the data lifecycle is not managed holistically. Data quality is inconsistently addressed through manual reporting and ad hoc remediation, with no profiling tools available to support proactive monitoring. Metadata practices are fragmented, leading to inconsistent definitions and documentation. Multiple glossaries, data models, and dictionaries exist but are not centrally maintained. There is no implemented data catalogue or search capability. Data observability is limited to high-level infrastructure metrics for cloud services, with no granular visibility into data flows. Some operational
-------------------------------	---

	monitoring tools are partially deployed but not integrated, restricting end-to-end oversight. Privacy controls such as data masking and obfuscation are applied inconsistently, and access management is handled through Entra ID and role-based controls across various platforms. However, enterprise-wide record management, archiving, and disposal capabilities are absent, with only isolated project-based implementations. Master data management is not in place, as the current reliance on a monolithic application has reduced the perceived need. This approach may not be sustainable as the application landscape evolves, particularly in support of future claims and policy systems.
Future State expectations	The future-state solution is expected to deliver a comprehensive and scalable data governance framework that supports consistent, trusted, and well-managed data across the organisation. It must enable fine-grained data lifecycle controls including tiering, retention, archival, and deletion, ensuring that data is managed efficiently and in alignment with business, regulatory, and operational requirements. Automated data lineage must be captured across ingestion, transformation, and consumption layers to provide full visibility into how data moves and evolves. This transparency will support impact analysis, root cause investigation, and compliance reporting. Stakeholders must be empowered to collaboratively manage and publish business glossary terms through governed workflows that include approvals, version control, contextual relationships, and hyperlinking within organisational documents and systems. The solution must also provide a unified data dictionary and catalogue that offer business-friendly definitions, automated approval workflows, collaborative access, and visualisation of data flow and lifecycle. Data quality management capabilities must include profiling, rule and template creation, metric monitoring, data cleaning and enrichment, matching and deduplication, and reporting for both operational and executive audiences. These capabilities must support multi-user access and be integrated with lineage tools to enable impact and root cause analysis. Metadata must be centrally managed and discoverable, with support for taxonomy-based categorisation, reporting, statistical use, and version control. Master data management capabilities must support synchronisation across systems, rule-based entity matching, propagation of trusted records, and full auditability. Privacy and security must be addressed through consistent data masking and obfuscation of sensitive information. End-to-end observability must be provided through metrics, logs, and traces for data

	pipelines and queries, enabling effective monitoring, troubleshooting, and governance. Finally, the solution must support policy-as-code to ensure governance policies are consistently defined, enforced, and maintained across all data platforms and domains.
--	--

3.6 Data Sharing

Current State overview	There is no standard for how data is shared with external stakeholders.
Future State expectations	The future-state solution is expected to provide open and flexible connectivity that enables seamless integration with third-party tools and platforms. This includes support for standard interfaces such as JDBC, ODBC, SQL endpoints, and REST APIs, allowing users to connect analytics, reporting, and operational systems without custom development or Supplier lock-in. Secure and governed data sharing with external organisations must be fully supported. The solution should offer fine-grained access controls, data masking and filtering capabilities, and comprehensive auditing of shared data. These features must be configurable to align with contractual obligations and regulatory requirements, ensuring that data is shared responsibly, transparently, and in accordance with enterprise governance policies.

3.7 Artificial Intelligence

Current State overview	There is no standard for how AI is used in the organisation.
Future State expectations	The future-state envisions a platform that integrates seamlessly with established machine learning frameworks while enabling agentic AI to drive autonomous and intelligent outcomes. It must provide strong governance and version control for training datasets and models, ensuring transparency, reproducibility, and compliance. The solution should deliver AI assistance tailored to developers, analysts, and end users, improving productivity and accessibility to advanced analytics across the organization. Suppliers are expected to present a clear roadmap that demonstrates ongoing investment in AI capabilities, with near-term enhancements and long-term innovation aligned to emerging technologies and organizational priorities.

3.8 Platform - General

Current State overview	The current data landscape is fragmented and reflects historical practices and the absence of a unified approach. Analytics efforts remain concentrated on a limited number of data domains, primarily sourced from a single legacy system. This has resulted in a constrained view of enterprise data, leaving many business areas without the insights needed for informed, evidence-based decision-making.
Future State expectations	The future-state solution is expected to deliver a modern, enterprise-grade data platform that supports scalable analytics, governed collaboration, and cross-domain interoperability. It must align with contemporary architectural patterns, enabling progressive data quality and logical or physical separation of data across layers and domains. The platform should support a domain-oriented architecture with delegated administration, allowing business units to manage their own data products while adhering to enterprise governance, security, and interoperability standards. Shared semantics, standardized data contracts, and a centralized catalogue must enable consistent reuse and integration across domains. Collaboration must be embedded throughout the platform, with support for commenting, lineage annotations, notifications, and shared development workflows. The solution must support separation of storage and compute to enable cost-effective scalability. It should offer workload isolation, resource quotas, and concurrency controls at the domain or team level, along with tagging and labelling capabilities to support cost allocation and showback or chargeback reporting. The charging model must be transparent and cover data movement, storage, and querying. Reference and master data management must be supported through capabilities for defining golden records, managing hierarchies and relationships, ensuring data quality and lineage, and enabling reuse across operational and analytical systems. Development and deployment workflows must include environment promotion (Dev/Test/Prod), approvals, audit trails, parameterization, secrets management, and support for Infrastructure as Code. The platform must enable source control for all code, configuration, and reports, and support automated testing of pipelines, data contracts, and analytics assets. MLOps capabilities must be included to operationalize machine learning across the lifecycle. Security must be comprehensive, and enterprise aligned. The platform must implement role-based access control with least-privilege principles, support row- and column-level security, and apply data masking where appropriate. Integration with identity and access management systems must support single sign-on, multi-factor authentication, and SCIM-based provisioning. Secrets must be securely managed through integration with enterprise vaults, and all access and administrative

	actions must be captured in immutable audit logs exportable to SIEM platforms. Connectivity must be secure and governed, with support for private endpoints and links that align with enterprise networking policies. Attribute-based access control (ABAC) must enable context-aware authorization, and privileged access management must include just-in-time elevation, credential rotation, session monitoring, and approval workflows. Finally, records management should be supported across the platform, including classification, retention, disposition, secure storage, auditability, and compliance with regulatory and legal requirements.
--	--

4. Contextual information

The following provides a high-level overview of the WCQ data environment to provide Suppliers with the relevant information to assist with responding to this ITO. Whilst all attempts have been made to ensure this is as current as possible, these high-level details provide a state of play and should be considered as a guideline only.

NOTE TO SUPPLIER

WCQ is at the early stages of a large-scale transformation, some of the below information is likely to change in the future. The target state technology landscape is not completely known; however, WCQ will indicate what is known where applicable.

4.1 Customer experience

4.1.1 Experience for internal and external users

WCQ's MDP is a foundational enabler of the broader whole-of-organisation transformation. The data program aims to uplift data maturity, data visibility, improve decision-making, and reduce risk through better governance, integration, and analytics capability.

The overarching customer experience goal is to deliver a proactive, and supportive experience to the organisational data users to have access to governed and report ready data sets and tools to self-serve and analyse data.

To achieve this, WCQ requires a MDP that ensures:

- a) Easy access to accurate and relevant information for internal staff, reducing reliance on deep domain expertise and minimizing stress during high-pressure interactions.
- b) Personalized and context-aware support for external users, improving self-service capabilities and reducing friction across all channels.
- c) Consistent experience principles that foster a customer-centric culture and serve as benchmarks for all interactions, ensuring trust, transparency, and empathy.

The platform must empower WCQ staff with timely insights and actionable content, enabling them to focus on supporting customers in their time of need while maintaining efficiency and compliance.

4.2 Data volumes and Types of data

4.2.1 Locations

WCQ operates out of a single central location in central Brisbane. Staff are mostly hybrid, with a 5 in 10 expectation. We do not have in person services such as a branch, however WCQ staff do go out to various locations for events such as employer education and provider outreach.

4.2.2 Data volumes

WCQ currently has multiple data assets e.g., Oracle, SAS Data sets, QVD (QlikView Data) files, File servers (Fsx).

As part of the 2030 Strategy, WCQ plans to introduce multiple new applications (mostly SaaS). The landscape of source systems in the target state is indicated by the below:

- CPIS (existing and to be decommissioned)
- Knowledge management (new)
- CRM (Customer Relationship Management) (new)
- Policy Management (new)
- Claim Management (new)
- Injury Management (new)
- Human resource management system (HRMS)(new)
- Risk (existing but upgraded)
- Finance (existing but upgraded)

The data volumes will considerably increase taking into consideration the following factors

- a) the ingestion of these new systems data into the MDP
- b) the ingestion of current systems data as they are decommissioned for archival purposes and historical reporting purposes for advanced analytical use cases
- c) ingestion of data from various external systems
- d) Retaining data for servicing various data obligations
- e) new data assets produced because of increase in data received or shared with external stakeholders
- f) new data assets produced because of increase in self-serve analytics capabilities

The following are claim and policy volumes in WCQ

Organisation	Employers	Workers
Customer calls to the contact centre: 337,344	Employers insured: 181K Onsite audits by compliance advisors: 1,028	Injured workers supported through a claim: 74K

Referrals to return-to-work providers: 13,007		New common law claims: 3,392
		Workers with a primary mental injury claim: 3,633

Note: Further details can be found in WCQ Annual report

<https://www.worksafe.qld.gov.au/resources/publications/annual-reports/annual-report-2024-2025>

WCQ currently holds data in various locations:

Type	System Type	GB	Number of Tables
Oracle	Source System	1724	1719
Oracle	Source System Reporting Database	8	66
Oracle	Data Lake	648	235
Oracle	Data Warehouse	541	254
SAS	Analytical Data Sets	160	150

4.2.3 Support hours

WCQ operates only in Queensland and thus are not subject to the time zones of other states or regions.

WCQ run a full operational team on all QLD business days, Monday to Friday, 8am-5.30pm. WCQ do not provide any other customer support outside of these hours beyond our online services which operate without an agent.

4.2.4 Peaks

WCQ data workload remains largely consistent throughout the year with variety of data and analytics use cases that will be serviced from the MDP.

These are triggered by

- the two claim peaks a year (generally March/April and October).
- during 'premium season', there is an uplift in contact from employers to renew their policy, this runs from June to August every year and results in increase engagement of 47% during this period.

The MDP will support various of use cases throughout the year including:

- Operational: Intraday (where data from multiple data sources needs to be combined for strategic reporting)
- Scheduled reporting: Daily, Weekly, Monthly, Quarterly, Annually
- Scheduled advanced analytical workloads: Machine learning model runs, Pricing and Valuation Actuarial Model runs
- Other use cases to support data needs of new applications introduced as part of 2030 program

4.3 Current Data and analytics

WCQ currently operates a complex, multi-tool analytics and reporting environment comprising:

- a) A bespoke data warehouse supported by a purpose-built transformation application.
- b) Relational databases (Oracle) for exploration, cube and data mart creation.
- c) Data marts / data sets: Qlik Sense data marts and data sets in Oracle.
- d) Reporting Tools: Qlik Sense, Microsoft Power BI (currently limited use), SAS, Jasper, proprietary etc.
- e) Analytical and Machine Learning model technologies: R, Python, Java

Access to reporting is limited and self-service reporting is not implemented. This fragmented landscape increases complexity, maintenance overhead, and data latency. WCQ has chosen Microsoft Power BI as the strategic reporting and visualization platform.

4.4 MDP Users and Source Systems

4.4.1 User types

The following represents the human users of data and analytics services that will interact with the MDP.

1. Data Management Professionals: manage data lifecycle, quality, and metadata
2. Data Governance Professionals: oversee compliance, policy enforcement, and stewardship
3. BI Professionals: build reports, dashboards, and semantic models
4. Analytics Professionals: develop models, conduct exploratory analysis, and interpret insights
5. Other IT Professionals: support platform operations, integration, and security
6. Business Users: consume reports, dashboards, and insights for decision-making
7. Citizen Analysts: use low-code/no-code tools for ad-hoc analysis
8. External Users: data supplied to various employers to enable them to perform reporting and analytics on their claims and policies, e.g., trends on injuries, comparison to similar industry peers

4.4.2 MDP Source Systems

The following represents the systems that will interact with the MDP for the various data and analytics needs

1. Business applications: Core operational platforms such as CRM, Claims Management, Policy Management, Injury management, and Contact Centre solutions.
WCQ is embarking on a significant transformation to modernise these

platforms, moving from legacy and aging systems to contemporary, largely SaaS-based solutions.

2. Corporate applications: Enterprise systems including HRIS and Finance platforms that provide authoritative source data for workforce and financial information. These applications are largely SaaS-based and comprise a mix of existing solutions and to be implemented platforms as part of WCQ's modernization strategy.
3. Integration Services: Securely and reliably deliver data from source systems to the MDP via APIs, streaming, and file-based exchanges; trigger and provision outputs from ML/AI operations; enforce data quality through validation and governance; and provide operational and security monitoring for end-to-end observability and compliance.
4. External Systems: Several defined data sets are provided to the regulator to perform for oversight and regulation of workers compensation scheme. Data sets are acquired from external sources and industry benchmarks to serve as reference data and enrich analytical models.

4.5 Types and Frequency of Data

4.5.1 Types of data

The following represents the different types of data received from source applications

1. Domains of Data
 - a. Claims
 - b. Insurance policy
 - c. Injury
 - d. Payment information
 - e. Medical information
 - f. Customer personal information
 - g. Reference data
 - h. Historical data
 - i. Employee data
 - j. Financial information

Note: the above data could be classified into PCI, PII, PHI, PFI and would be sensitive in nature

2. Technical types of data
 - a. Structured
 - b. Semi-structured
 - c. Unstructured

4.5.2 Frequencies of data

The following represents the different frequencies at which data will be received in MDP:

1. Near Realtime

- a. Event streams from source applications
 - b. CDC (Change Data Capture)
- 2. Batches
 - a. Daily
 - b. Intraday
 - i. Hourly
 - ii. Multiple times a day

4.5.3 Information Asset Classification Policy

All Information Assets at WorkCover are to be classified based on Confidentiality, Sensitivity, Integrity, Availability & Criticality to meet Queensland Government requirements, as well as align with Federal Government and APRA CPS-234 as part of being a world class organisation.

Exhibit A provides WCQ's Information Asset Classification Policy, labelled *5.3.1 Information Classification Policy Final.PDF*.

4.5.4 Access Management Policy

This Policy forms part of the WorkCover Information Security Management System and compliance with it is critical for maintaining adherence with Queensland Government Information Standard 18 as well as maintaining WorkCover's Risk Appetite rating for Cyber Security & Privacy.

Exhibit B provides WCQ's Access Management Policy, labelled *5.1.1 Access Management Policy Final.PDF*.

5 MDP Technical landscape

5.1 Current State, Environments

WCQ distributes a Standard Operating Environment (SOE) across all devices provided to staff that currently installs Windows 10. If required, any rich client components or applications to be installed on to a device must be compatible with Windows 10 and Windows 11.

5.1.1 Browser support

Externally hosted web interfaces are required to be fully functional using the following browsers:

- Microsoft Edge - version 135.0.3179.98
- Google Chrome – 135.0.7049.43

The browser interactions are capable of full functionality using standard user privileges.

No specific requirement is specified for browsers on mobile devices (e.g. Android / iOS).

NOTE TO SUPPLIER

The Supplier should ensure that the System is upgraded as required in line with web browser evolution during the term of the agreement i.e. as new web browser versions become available.

5.1.2 Workstation performance

For the purposes of rich client applications or component, WCQ workstations can be assumed to have a minimum of:

- Ultra 7 CPU with 6 P cores minimum
- 32 GB RAM
- Extensive free disk space on System/Boot system drive.

NOTE TO SUPPLIER

The System should be designed and built such that it will not restrict the users working efficiently on the workstation with other applications or processes during an unfinished process

5.1.3 SSO and SCIM

WCQ currently uses Entra ID within the technology landscape. It is expected that Authentication and Authorisation including Single Sign-On (SSO) is implemented using the WCQ identities via SAML, OAuth2, or OpenID Connect protocols.

5.2 Identity and Access Management

Currently Identity and Access Management is delivered using Active Directory/Azure Active Directory.

5.3 Enterprise Integration Platform

WCQ largely utilises point-to-point integration methods of various types including system APIs, as well as batch, scheduled, and file-based integrations via the Control-M product (both on-premises and cloud versions in use currently).

NOTE TO SUPPLIER

Future direction: WCQ is currently developing a long-term strategic roadmap that includes the procurement and implementation of an Enterprise Integration Platform. Any proposed solution should allow for the ability to perform any required integration via both point-to-point and leveraging an industry standard integration platform.

5.4 Applications and platforms

WCQ currently utilise a monolithic, highly customised central system which manages all claims, policies, customer profiles, etc. WCQ are embarking on a significant transformation to move from customer/aged platforms to modern, largely SaaS platforms, befitting an insurer of our importance and size. WCQ do not wish to invest in modifying or integrating into our existing platforms if it can be avoided, however will expect to for new platforms. WCQ approach for the transformation is standard, modern, enterprise grade platforms. Supplier responses should assume WCQ would be utilising common platforms in the future.

6 Implementation and transition

6.1 Implementation

Key functions within the organisation play a critical role in governing and managing the portfolio. These include the Enterprise Portfolio Management Office (EPMO) and Transformation Delivery. EPMO leads strategic portfolio planning, provide oversight and develop governance frameworks that ensure aligned, value-driven delivery. Transformation Delivery manages project execution and coordination, ensuring high-quality outcomes by building strong capability and applying best practice methods. WCQ's delivery methodology is predominately waterfall with smaller changes being delivered via Agile teams. We use Microsoft Project for delivery/task management within project delivery and engineering teams. Microsoft SharePoint is used by engineering for knowledge management and project delivery use it for collaboration. Miro is used for whiteboarding/collaboration. Visio and Microsoft Office suite are also utilised.

The Portfolio Governance Committee (PGC) is the governing body for the Portfolio. PGC accountabilities include prioritising funding and capacity, ensuring that portfolio outcomes are delivered and ensuring that the portfolio operates within risk appetite. Individual programs and projects are governed by program and project boards that are chaired by the program or project Sponsor. These boards operate within the guardrails set by the PGC. The portfolio governance framework is designed to ensure that the right information flows between the different layers, and that decisions can be made in a timely manner at the appropriate level. Both PGC and program and project boards are held monthly.

6.2 Delivery Approach and Transition

WCQ requires a structured, progressive transition of knowledge, responsibility, and operational ownership from the Supplier to WCQ internal teams. The solution will be delivered and transitioned via a series of **N incremental Drops** (anticipated to be three major Drops, but the exact number will be confirmed during solution design), followed by an ongoing steady-state phase.

Transition

The transition model below will apply to every Drop.

1. **Platform Stand-up and Early Drop(s)**
 - a) **Functionality:** Initial platform stand-up plus base patterns, functions, pipelines, and capabilities required to support current data and the new platform(s).
 - b) **Responsibility:** Supplier leads all delivery, configuration, and operational activities. Supplier staff to provide regular updates and showcases of completed work and/or significant decisions.
 - c) **WCQ Role:** WCQ teams shadow Supplier staff on all processes and activities to acquire deep system and operational knowledge. All significant decisions made need to be reviewed by WCQ staff.
 - d) **Support Model:** **Supplier Supported** (Supplier is the sole provider of operational and support services).
2. **Intermediate (Hybrid) Drop(s)**
 - a) **Functionality:** Progressive delivery of additional patterns, functions, pipelines, and scope increments (for example, HRIS, CRM, or other agreed capabilities).
 - b) **Responsibility:** Hybrid model – Supplier and WCQ jointly execute delivery and operate the platform. Supplier's developers only deploy to DEV and participate in testing.
 - c) **WCQ Role:** WCQ actively participates in configuration, testing, deployment, and day-to-day operations alongside the Supplier. Production deployments are managed by WCQ.
 - d) **Support Model:** **Hybrid**.
3. **Final Drop(s) leading to Full Scope**
 - a) **Functionality:** Delivery of the remaining patterns, functions, pipelines, and capabilities required to achieve the complete agreed scope.
 - b) **Responsibility:** From the start of the final Drop, WCQ manages all day-to-day operations and further enhancements.
 - c) **Supplier Role:** Supplier shifts to providing augmented support only (reactive and as requested) and resource augmentation services if required.
 - d) **Support Model:** **Augmented**.
4. **Ongoing (post-final Drop steady state)**
 - a) **Functionality:** Full production scope is live and in continuous operation.
 - b) **Responsibility:** WCQ fully manages the platform, all ongoing development, maintenance, and operations.
 - c) **Supplier Role:** Supplier provides ongoing support services under standard commercial terms (defect resolution, patches, agreed enhancements, etc.) as well as ongoing resource augmentation when required.
 - d) **Support Model:** **Augmented** (WCQ is the central operating entity; Supplier is one of several supporting parties).
5. **Supplier Obligations Across All Drops**

The Supplier must actively enable and execute this progressive transition by:

- a) Facilitating comprehensive WCQ shadowing from day one of the stand-up phase,
- b) Collaborating in joint delivery and operations during all Hybrid-phase Drops,
- c) Continuously transferring knowledge, documentation, runbooks, tooling, and operational practices,
- d) Ensuring WCQ is fully capable of autonomous management from the commencement of the final Drop onward.

By the completion of the final Drop, WCQ will assume full operational ownership, and the Supplier's role will be primarily to provide traditional augmented support services.

The Supplier's proposal must demonstrate how it will flexibly apply this transition framework regardless of the final number of Drops agreed. Alternative proposed approaches will be welcomed where these clearly demonstrate better value for WCQ.

6.3 Proposed Delivery Schedule

This information is shared to inform Suppliers of WCQ's proposed delivery approach and does not constitute a commitment. The intent is that it will help inform the Supplier and that the Supplier should develop their own delivery schedule, based on their experience, proposed solution, and taking into consideration the organisational change impacts to WCQ as part of the transition-in.

Milestone	Targeted Completion
Planning Phase	
Modern Data Platform - ITO issued to market	21 Jan 2026
Modern Data Platform – Market Briefing	23 Jan 2026
Modern Data Platform – Deadline for Supplier Responses	20 February 2026
Modern Data Platform – Supplier Demo's	16 - 27 March 2026
Modern Data Platform – Supplier Engagement Contract Finalisation	June - August 2026
Modern Data Platform – WCQ Solution Design and Service Model Design	10 July 2026
Delivery Phase – (MVP) Platform Setup and Operational Foundations	
Modern Data Platform – Contract Start	7 Sep 2026
Modern Data Platform – Platform Provisioned	2 Oct 2026
Modern Data Platform – Pattern Design Established	30 Oct 2026
Modern Data Platform – Support Tooling and Processes	27 Nov 2026
Modern Data Platform – Early Life Support Model in Place	18 Dec 2026
Delivery Phase – Tranche 1	
Modern Data Platform – Regulatory Reporting Solution	18 Dec 2026
Modern Data Platform – Management Reporting Solution	18 Dec 2026

7 Support Services

7.1 Service model expectations

WCQ have modern and capable multi-cloud infrastructure, we are SaaS / PaaS first for our transformation.

7.2 Platform support model

WCQ intends to operate the modern data and integration platforms using a tiered support model aligned to ITIL service management practices. The platform will be treated as a product, with clear ownership, defined support levels, and continual improvement.

7.2.1 Target Support Principles

- a) WCQ will retain overall ownership and accountability for the platform.
- b) Supplier will provide product-level support for the technologies they supply.
- c) Operational support will follow a multi-tier model (L1, L2, L3) aligned to ITIL incident, problem, and change management practices.
- d) The support model must enable knowledge transfer, capability uplift, and operational resilience.

7.2.2 Indicative Support Model

- a) **Level 1 (L1):** Monitoring, alerting, and initial triage, supported by automation where possible.
- b) **Level 2 (L2):** Operational support, incident response, and runbook-based remediation, potentially provided through a combination of augmentation and managed services to support extended hours or 24x7 coverage.
- c) **Level 3 (L3):** Deep technical support, root cause analysis, and permanent remediation, retained internally by WCQ.

7.2.3 Service Management Alignment

The support model is expected to align with ITIL practices, including but not limited to:

- a) Incident Management
- b) Problem Management
- c) Change Enablement
- d) Service Request Management
- e) Continual Service Improvement

7.2.4 Flexibility and Supplier Input

WCQ recognises that the optimal support model may vary depending on the selected technologies and architectural patterns. Suppliers are encouraged to:

- a) Propose support models aligned to their technologies
- b) Identify opportunities for operational efficiency and resilience
- c) Recommend appropriate use of managed services or augmentation where beneficial.

Any proposed variations will be evaluated against WCQ's principles of ownership, accountability, sustainability, and capability uplift.

7.3 Monitoring

WCQ has cloud-based environment. Accordingly, the monitoring technology we support is:

- a) AWS OpenSearch is used for searching documents from operational applications.
- b) Datadog for ingestion of application logs, observation and monitoring.
- c) AWS Security Hub, AWS Security Lake, and Microsoft Sentinel for Security and SIEM.

NOTE TO SUPPLIER

Any proposed MDP solutions must be able to integrate with these systems, presenting the required logs to each system either out of the box or by configuration only.

7.4 Support incident logging

WCQ uses ServiceNow as its ICT support ticketing solution and has standard integration patterns defined. This is for both receiving and sending various message types (e.g. incidents) from/to other systems.

Our service ops team utilise standard ITIL processes.

7.5 Account Management Framework

WCQ's preference is for a single Account Manager across the whole business, with local technical service managers.

The Account Manager needs to be of suitable seniority to facilitate any contractual issues, disputes, or resolutions of key delivery elements. The Account Manager is expected to have regular face-to-face time with WCQ for governance meetings.

WCQ expect, at a minimum, the following Account Management Governance Framework:

Meeting Type	Description
Account Management	Day to day provision of services. Service performance reviews. Resolve commercial / contractual issues.
Program Management	(During implementation) Performance review, of implementation(s) escalation of issues and network planning.
Relationship Management	Strategic planning. Sharing of WCQ's future plans.

7.6 Service Levels

WCQ expects that the Supplier offers several support options with varying service levels. WCQ request a proposal which is suitable for our needs, without being excessive.

WCQ expect a clear view of what to expect, and how these are reported and maintained. Please provide detailed explanation in Part D – Response Form.

7.7 Business Continuity

In the event of disaster at a core platform location, at a minimum, WCQ sites should be able to fail over to an alternate platform with minimal service disruption in a mostly automated way to ensure normal business operations can continue.

8 Use cases

The use cases are to encourage responses to specific scenarios WCQ plans to incorporate in the MDP.

Use Case No	Category	Requirement
1	Unified Claim Status Analysis Across Multiple Data Sets (UC)	Background: Claim status information is captured across multiple datasets and systems, each serving different business purposes (e.g., regulatory reporting, actuarial modelling, cost analysis, and operational tracking). Jane Doe wants to analyse all claims managed by her team over the last quarter and understand the current claim status for each claim. However, claim status definitions vary by dataset context. Jane Doe wants to analyse all the claims that have been managed by her team over the last quarter. It is important to know what the current claim status is for each claim. Claim status can differ across data sets and systems. Objectives • Searches across data sets and provides listing of datasets with their description which contain claim status and only the ones users approved to access • Advises how these data sets can be joined together • Definition of each field within the data set and context of the individual data set • Ensure Personally identifiable fields are only available to the users who have authority to access it. Advise how this access model will be implemented in the platform • Expose the data set to Power BI for consumption and reporting • Ability to profile the data sets and Report DQ issues with each data set Data Sets Used

		1. Claim Data set 1: Supplied to Regulator 2. Claim Data set 2: Used by Actuaries for Policy Valuations 3. Claim Data set 3: Used to determine Total cost of claim 4. Claim Data set 4: Used to determine Number of claims not closed yet Success Criteria • Accurate discovery of all datasets containing Claim Status, limited to authorised access. • Clear join guidance with validated keys, effective dates, and documented risks. • Context-aware field definitions available for each dataset, preventing misinterpretation. • PII protected end-to-end, with RBAC/ABAC, column-level security, and auditable access. • Curated semantic model published to Power BI, enabling reliable reporting for Jane's team. • Data profiling and DQ reporting operational, with alerts on threshold breaches and visible remediation progress. Note: Claim Status reported in Data set 1 would be contextually different to Data Set 2 as 1 is as per agreement with Regulator and the other is for Actuarial Modelling
2	Needs Model for Prioritizing Injured Worker Support (NM)	Background: Use predictive classification to identify and rank injured workers' support needs based on real-time claim data, enabling Customer Advisors and Managers to prioritize interventions for recovery and return-to-work outcomes. The Needs Model is designed to help Customer Advisors and Customer Managers manage caseloads efficiently by highlighting workers who require immediate attention and those nearing readiness for suitable duties. It runs daily on all open accepted claims, classifying workers' needs based on multiple datasets and ranking them by impact on wage payments and return-to-work progress. Workers can have multiple needs simultaneously, with prioritization guiding case management actions. Objectives • Automate identification of high-priority cases for proactive support. • Provide actionable insights for Customer Advisors and Managers. • Improve recovery outcomes and reduce wage payment exposure. • Enable timely negotiation and assignment of suitable duties. Data Sets Used 1. Wages 2. Suitable Duties (SD) with employer 3. Suitable Duties (SD) negotiation 4. Coping 5. Review for override 6. Review progress – Time lost claim 7. Review progress – Medical Expenses Only (MEO)

		8. Review progress – Ongoing 9. Surgery 10. Administrative Success Criteria • Daily classification of all open accepted claims. • Accurate prioritization of workers needing immediate support. • Clear visibility of workers nearing readiness for suitable duties. • Integration with case management workflows. • Operational monitoring of the Needs Model, including daily execution status, data freshness, classification volumes • ML lifecycle monitoring, including model performance, data and prediction drift detection, version control
3	Impact Analysis for Source Column Modification in a Modern Data Platform (IA)	Background: Perform end-to-end impact analysis when a source system modifies an existing column, to identify downstream effects across ingestion, storage, transformations, semantic models, reports, APIs, ML artifacts, KPIs, security, and testing, ensuring safe remediation with governance and communication. This use case addresses the scenario where a source system change request or release note indicates a modification to an existing column (e.g., rename, datatype change, nullability, domain/enum values, precision/scale, semantic meaning, format or unit). The objective is to analyse and quantify the downstream impact across all layers of the MDP, estimate remediation effort, and communicate implications to business users. Objectives • Detect and document all affected assets and processes. • Quantify technical and business impact. • Define remediation steps and testing strategy. • Ensure compliance with governance and communication protocols. Data Sets / Layers Impacted 1. Ingestion – Raw data pipelines (batch/streaming) 2. Storage – Bronze/Silver/Gold tables and views 3. Transformation / Business Rules – ETL/ELT logic, dbt models 4. Semantic Models – Power BI datasets, Analysis Services models 5. Reports / Dashboards – Visualizations, filters, KPIs 6. APIs / Data Contracts – External integrations and payloads 7. Machine Learning Models – Feature engineering, training datasets 8. KPIs / Measures – Business metrics and calculations 9. Security & Privacy – Data classification, masking, compliance 10. Test Plan – Unit, regression, schema, and data quality tests Success Criteria • All impacted layers identified and documented. • Remediation plan implemented without breaking downstream processes. • Business users informed of KPI/reporting changes. • Compliance and security policies updated.

		Post-deployment validation successful.
4	Records management and archiving (RM)	Background: The future claims management system (FCM) is designed for operational efficiency and only stores the current state of each claim and injured worker. Historical changes—such as status transitions, address changes, contact details are not retained in the FCM. However, regulatory compliance, audit requirements, and advanced analytics demand full historical visibility of claims, even after they are closed. To address this, the organization uses a data lake with a medallion architecture (Bronze → Silver → Gold) and an archive strategy with tiered storage (Hot, Warm, Cold). Additionally, claims may need to be reactivated after archival (e.g., due to litigation or aggravation of injuries, etc.), requiring a design that supports retrieval and rehydration from any layer. Objectives - Capture complete history of the claim - Persist all claim changes and events from operational systems in the Bronze layer for audit and lineage. - Enable analytics and compliance - Transform raw data into curated Silver (cleansed, conformed, historicised) tables and Gold aggregates for reporting and ML. - Implement tiered archival - Archive closed claims into hot, warm, and cold tiers to optimize cost and performance. To comply with Record Management requirement, store it in open format. - Support reactivation - Allow claims to be restored from any archive tier back into active layers without losing historical integrity. - Ensure governance and security – maintain audit trails, encryption, security classification to advise masking, lifecycle policies aligned with regulatory record keeping and privacy requirements. Data Sets / Layers Impacted - Ingestion – Raw data pipelines (batch/streaming) - Storage – Bronze/Silver/Gold tables and views - Storage – Record Archive - Control – Metadata catalogue Success Criteria - Historical Completeness - All claim changes and events are captured without data loss. - Tiered Archival Compliance - Closed claims are archived according to lifecycle rules with encryption and immutability for the life of the record. - Reactivation Capability - Claims can be restored from any archive tier into active layers within defined SLAs - Auditability & Lineage - Cost Optimization

		• Operational Continuity • Record lifecycle management
5	FinOps Reporting (FO)	Background The solution must operate alongside day-to-day analytics workloads without degrading performance or inflating costs unexpectedly. The organisation also needs unified observability across data pipelines and AI inferencing, consistent governance via policy-as-code, robust workload isolation with quotas, and cost transparency with showback/chargeback. Objectives 1. Cost & compute control: Provide transparent compute consumption and enforce guardrails (quotas, throttling, priority scheduling) so AI workloads don't impact BAU analytics. 2. Unified observability: Deliver end-to-end metrics, logs, and distributed traces across data ingestion, feature engineering, model training/inference, and downstream query workloads; support rapid troubleshooting and compliance monitoring. 3. Governance via policy-as-code: Define and enforce consistent data access controls, retention rules, PII masking, tagging standards, and workload policies across engines (e.g., Lakehouse SQL engines, stream processors, ML services). 4. Workload isolation & fairness: Enforce team/domain/project resource quotas and concurrency limits to guarantee stable performance and fair sharing. 5. Financial accountability: Tag resources for cost allocation, integrate with showback/chargeback, and provide real-time cost alerts to prevent overruns. Data Sets Used 1. Pipeline Metadata: Job IDs, correlation IDs, pipeline names, execution timestamps 2. Telemetry Data: Metrics, logs, distributed traces for ingestion, feature engineering, model inference. 3. Cost Tags: Cost Centre, team, environment, application, Data Domain 4. Compute & Capacity Metrics from Cloud Platform 5. Billing Export: Daily/weekly billing data for reconciliation. 6. Budgets & Alerts: Threshold configurations for cost and quota enforcement. Success Criteria: • Reporting on production resources not having mandatory cost tags • Real-time alerts fire at configured thresholds; at least one automated throttling event demonstrated in pilot without impacting BAU SLAs. • Quota breaches result in automated throttling with notifications; burst usage respects configured caps. • 100% of production pipelines emit standardized metrics/logs/traces; trace correlation ID coverage $\geq 95\%$.

		• Mean time to detect (MTTD) for pipeline failures < 5 minutes; mean time to recover (MTTR) < 30 minutes. • All governance policies managed as code with automated compliance checks; no untagged or unmasked PII data movements in production. • Platform stays within defined daily/weekly compute quotas; any breach triggers throttling and notification. • Cost dashboard shows per-job and per-team compute and cost within $\pm 5\%$ of billing export reconciliation.
6	Master Data Management (MDM)	Background The solution provides Master Data Management (MDM) capabilities to create and maintain a single source of truth. It supports data synchronization, rule-based entity matching and merging, propagation of trusted master data, version control, auditing, multi-user access, and stakeholder notifications. Objectives • Consolidate master data from multiple sources into a unified model. • Automate rule-based comparison and merging of entities. • Ensure trusted master data propagation to downstream systems. • Enable restoration of incorrect merges and maintain version control. • Provide audit trails, multi-user collaboration, and notifications. Data Sets Used • Source system master records (CRM, ERP, eCommerce). • Reference data (codes, taxonomies, address validation). • MDM repository (canonical models, rules, workflows). Success Criteria • Duplicate reduction and attribute completeness. • Auditability and version control for all changes. • Low latency for master data propagation.

7	AI Data Governance (AIDG)	Background The Modern Data Platform solution provides ethics management capabilities to ensure responsible data usage across the organization. These capabilities include automated compliance checks, bias detection, and transparency features that align with regulatory standards and organizational values. By embedding ethics into the data lifecycle, the platform helps mitigate risks related to privacy, fairness, and accountability. Objectives • Embed ethical principles into all data processes and analytics workflows. • Ensure compliance with regulatory frameworks (e.g., GDPR, AI ethics guidelines). • Detect and mitigate bias in data models and decision-making. • Provide transparency through auditable data pipelines and ethical reporting. • Build trust among stakeholders by demonstrating responsible data practices. Data Sets Used • Customer Data: Demographics, transaction history, behavioural patterns. • Operational Data: System logs, performance metrics, process workflows. • Third-party Data: Market trends, social sentiment, external benchmarks. • Ethics Metadata: Policy rules, compliance standards, bias detection parameters. Success Criteria • Compliance Score $\geq 95\%$ across all data pipelines. • Zero critical ethical violations detected in quarterly audits. • Bias detection accuracy $\geq 90\%$ in predictive models. • Positive stakeholder feedback on transparency and accountability. • Reduction in regulatory incidents by at least 50% within 12 months.
---	---------------------------	---

Note: The traceability of the Functional Requirements to the above use cases can be found in Part D - Attachment 1 - Requirements (Functional & Non-Functional)_v0.1.

9 Attachment 1 Functional Requirements

No	Category	Description
MDP_FR1	Data Acquisition	The platform must provide flexible, robust mechanisms to ingest structured, semi-structured, and unstructured data from diverse source systems using batch, micro-batch, and streaming paradigms
MDP_FR2	Data Acquisition	The platform must support real-time or near-real-time Change Data Capture from operational databases and other transactional systems
MDP_FR3	Data Acquisition	The platform must offer fine-grained control over what data is ingested, high-throughput parallel ingestion (both within a single source and across multiple sources), selective column/table ingestion, and automated, configurable handling of schema drift and schema evolution during ingestion
MDP_FR4	Data Acquisition	The platform must support a variety of connectivity mechanisms
MDP_FR5	Data Acquisition	The platform must provide data flow orchestration and scheduling with visual pipeline representation and dependency management.
MDP_FR6	Data Acquisition	The platform must support Zero-copy ingestion, where supported by the source
MDP_FR7	Data Acquisition	The platform must ensure resilience and robustness in it's data acquisition processes
MDP_FR8	Data Acquisition	The platform should integrate with integration platforms
MDP_FR9	Data Storage	The platform must support the storage of various data formats
MDP_FR10	Data Storage	The platform must support an open table format
MDP_FR11	Transformations	The platform must deliver industry-standard data preparation and transformation capabilities, including native integration or interoperability with common ETL/ELT frameworks and provide unit testing capabilities
MDP_FR12	Transformations	The platform must support code-based transformations.
MDP_FR13	Transformations	The platform must support rich SQL-based transformations
MDP_FR14	Transformations	The platform must support near real-time and streaming transformations
MDP_FR15	Data Analytics	The platform must deliver governed, repeatable, scheduled reporting and interactive dashboards optimized for enterprise-wide consumption.
MDP_FR16	Data Analytics	The platform must enable business users and analysts to independently perform ad-hoc exploration, querying, and analysis with minimal IT dependency, using familiar languages and intuitive interfaces.
MDP_FR17	Data Analytics	The platform must support predictive modeling, machine learning, and statistical analysis

No	Category	Description
MDP_FR18	Data Analytics	The platform must support reusable semantic models and datasets optimized for both BI and ML workloads
MDP_FR19	Data Analytics	The platform must support real-time or near real-time operational monitoring, including ingestion, processing, and visualization of streaming data
MDP_FR20	Data Sharing	The platform must enable secure data sharing across business units and external partners
MDP_FR21	AI	The platform must support end-to-end lifecycle management of ML/AI models
MDP_FR22	AI	The platform must demonstrate a clear roadmap for AI capabilities and tightly integrate AI features with enterprise data governance, security, audit, and compliance frameworks.
MDP_FR23	AI	The platform must provide transparent compute consumption and cost/control guardrails for AI workloads (quotas, throttling, priority scheduling, etc.)
MDP_FR24	AI	The platform must seamlessly integrate with leading ML frameworks and support building, deploying, and orchestrating agentic AI workflows
MDP_FR25	AI	The platform must provide built-in AI assistance tailored to various personas to accelerate productivity and democratize access to data and analytics.
MDP_FR26	Governance	The platform must automatically capture and visualize end-to-end, column-level data lineage across ingestion, transformation, and consumption layers
MDP_FR27	Governance	The platform must provide dynamic data masking, tokenization, and obfuscation of sensitive data
MDP_FR28	Governance	The platform must deliver unified observability (metrics, logs, distributed traces) and support policy-as-code to define, version, and enforce governance rules consistently across all data engines and domains
MDP_FR29	Governance	The platform must support and utilise a business glossary
MDP_FR30	Governance	The platform must support and utilise a data dictionary
MDP_FR31	Governance	The platform must provide tooling for a data catalogue
MDP_FR32	Governance	The platform must provide tooling for a data quality/health management
MDP_FR33	Governance	The platform must support metadata management
MDP_FR34	Governance	The platform must support the ability to model data conceptually and logically.
MDP_FR35	Governance	The platform must support fine-grained, automated data lifecycle policies
MDP_FR36	Governance	The platform should provide built-in ethics management
MDP_FR37	Governance	The platform should support master data management

No	Category	Description
MDP_FR38	General	Ingestion and transformation technologies should allow for metadata driven ETL/ELT processes
MDP_FR39	General	The platform should support modern data architectures with progressive data quality and logical/physical data separation.
MDP_FR40	General	The platform should support native enablement of Data Mesh via domain-owned data products, delegated administration, and centralized governance/security.
MDP_FR41	General	Provide reference architectures, implementation frameworks, best-practice playbooks.
MDP_FR42	General	The platform must ensure cross-domain interoperability
MDP_FR43	General	The platform must fully separate storage and compute with independent scaling and provide a clear, comprehensive charging model covering data movement, storage, and query/compute usage.
MDP_FR44	General	The platform must support workload isolation, enforceable resource quotas, and concurrency limits at team, domain, or project level to guarantee performance stability and fair resource sharing.
MDP_FR45	General	The platform must offer tagging/labelling of resources for cost allocation, integration with financial/showback-chargeback systems, and real-time cost monitoring with configurable alerts.
MDP_FR46	General	The platform must support full Dev/Test/Prod environment promotion with gated approvals, audit trails, parameterization, variable libraries, and secrets management across environments.
MDP_FR47	General	The platform must integrate with Git (or equivalent) for full version control of all code, reports, and platform configuration, including diff, branching, and merge workflows.
MDP_FR48	General	The platform must support Infrastructure as Code with templating for repeatable provisioning
MDP_FR49	General	The platform must enable unit and integration testing for code, pipelines, reports, and data contracts, plus built-in reconciliation/comparison capabilities between datasets.
MDP_FR50	General	The platform should support robust records management

10 Attachment 2 Non-Functional Requirements

No	Category	Description
MDP_NFR1	Scalability	The platform must be able to scale without performance degradation.
MDP_NFR2	Performance	The platform must be able to handle peak loads without negative impacts to end user experience.
MDP_NFR3	Availability	The platform must be highly available.
MDP_NFR4	Security	The platform must protect WCQ's information.
MDP_NFR5	Multi-Tenancy	The platform must protect WCQ's information from other customers using the platform.
MDP_NFR6	Configurability	The platform must allow a suitably trained client side user to configure the platform.
MDP_NFR7	Maintainability	The platform must remain current and secure.
MDP_NFR8	Extensibility	The platform features must be extensible via integrations to other platforms.
MDP_NFR9	Integration	The platform must integrate with other WCQ platforms/systems.
MDP_NFR10	Auditability	The platform must be fully auditable.
MDP_NFR11	Compliance	The platform must enable WCQ to comply with all applicable required legislations and regulatory standards.
MDP_NFR12	AI	The platform must provide secure, governed AI capabilities.
MDP_NFR13	Monitoring & Reporting	The platform must provide real time visibility for system health.
MDP_NFR14	Backup & Recovery	The platform must protect and restore our information in case of incidents or failures.
MDP_NFR15	Support & SLAs	The platform must be provided as a software-as-a-service (SaaS) encompassing all aspects of support and management.
MDP_NFR16	User Authentication and Access	The platform must enable our staff to utilise existing authentication and authorisation credentials.
MDP_NFR17	Solution and Vendor Governance	The platform vendor must have a mature governance operating model.
MDP_NFR18	Data Exit and Destruction (at end of contract)	The platform must support a secure data exit strategy.

11 Attachment 3 Future State Conceptual Architecture

WCQ's conceptual architecture document shall be provided under NDA. WCQ will issue this document on receipt of the Part A Attachment 1 Non Disclosure Agreement duly signed by the respondents authorised officer and returned to the WCQ Contact.
